

# On partial numberings

Dieter Spreen  
Universität Siegen, Germany

**Abstract:** Numberings are an essential tool in Markovian constructive mathematics. In the literature mostly totally defined numberings have been studied. Canonical numberings used in constructive investigations of topological structures such as the computable real numbers, however, are only partially defined, by necessity. Several central notions and results of total numbering theory could be transferred to the partial case. Yet, there are also structural differences.
